

Array Data Structures

261217 Data Structures for Computer Engineers

Patiwet Wuttisarnwattana, Ph.D.

patiwet@eng.cmu.ac.th

Computer Engineering, Chiang Mai University

Abstract Data Type

- ❑ Abstraction is the act of representing essential features without including the background details or explanations.
- ❑ Users can see what we can do with this data type without knowing the implementation
- ❑ Programmer can change the implementation without changing the input/output relationship

Abstract Data Type

First come first serve
First in first out

Insert

Find

Queue

- List implementation
- Array implementation
- Circular Array
- Enqueue at the back
- Enqueue at the front

Abstract Data Type

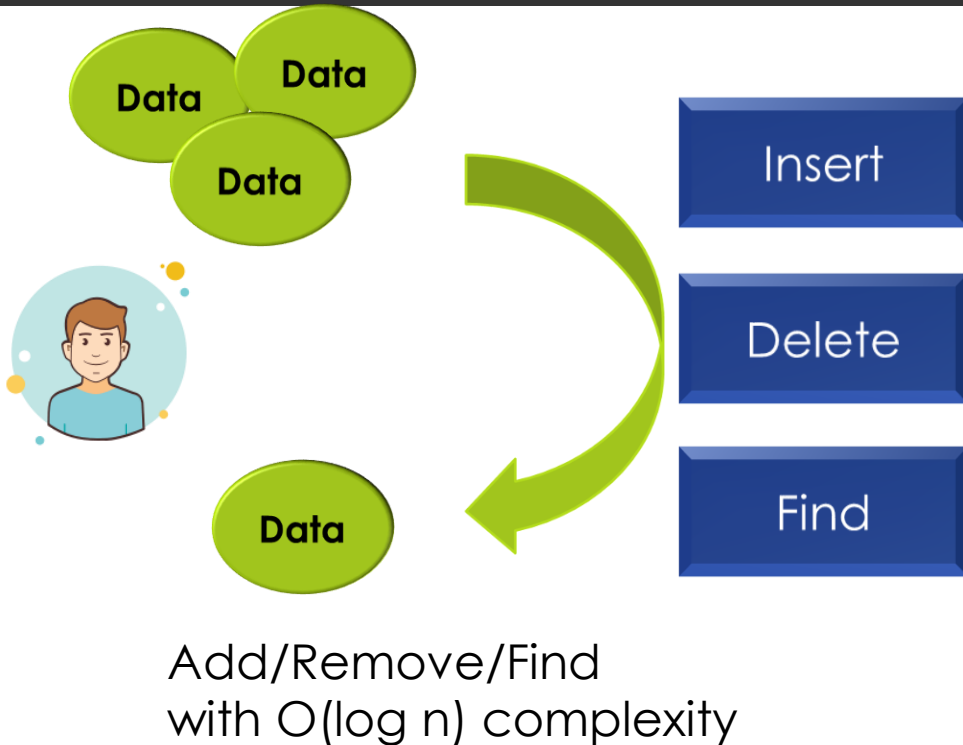

Priority Queue

- Multiple Queue implementation
- AVL implementation
- Binary Heap (Max/Min)
- Complete Binary Tree Implementation
- Array Implementation

Abstract Data Type

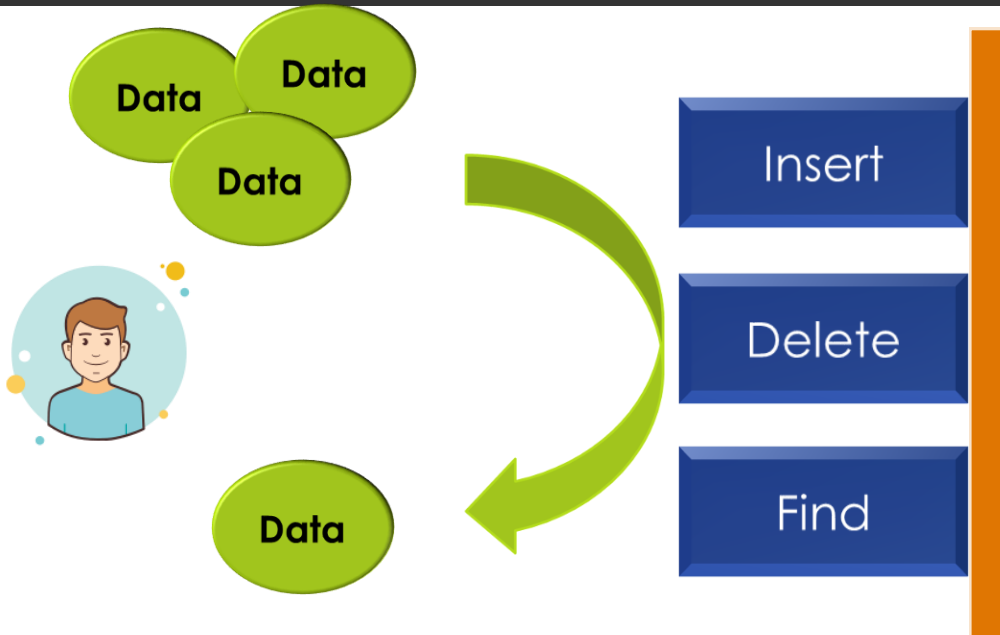

Balanced Trees

- Binary Search Trees
- Red-Black Trees
- AVL Trees
- Splay Trees
- B-Trees
- Array implementation
- List implementation
- Left/Right variables implementation
- Left/Right/Head variables implementation
- First child/Next sibling implementation

Abstract Data Type

Add or Remove or Find
with $O(1)$ complexity

Mysterious Data Structures

- Hash Tables
- Binary Heaps
- Stacks
- Queues
- ...

Data Structures covered in this class

■ Linear Data Structures

- Linked Lists
- Arrays
- Queues
- Stacks

■ Trees

- Binary Trees
- Binary Search Trees
- AVL Trees
- *B-Trees*
- *Splay Trees*

■ Priority Queues

- Binary Heaps

■ Hash Tables

- Hash Functions
- Collision Resolutions

■ Graphs

- BFS
- DFS

Array Data Structure

```
long arr[] = new long[5];
```

```
long arr[5];
```

```
arr = [None] * 5
```

1	5	17	3	25
---	---	----	---	----

1	5	17	3	25
8	2	36	5	3

Array

- Definition

- Array:

- Contiguous area of memory

Array

- Definition

- Array:

- Contiguous area of memory consisting of equal-size elements

Array

- Definition

- Array:

- Contiguous area of memory consisting of equal-size elements indexed by contiguous integers.

What's special about Arrays?

- Constant-time Access
- Given an index i , reading time and writing time are constant

$a[0] = 0$

0x0007 - 0x0026 $\leftarrow 0$

$a[2] = 2.00000001$

0x0047 - 0x0066 $\leftarrow 2.00000001$

$a[4] = 55555.66666666$

0x0087 - 0x00A6 $\leftarrow 55555.66666666$

$a[7] = 1$

0x00E7 - 0x0106 $\leftarrow 1$

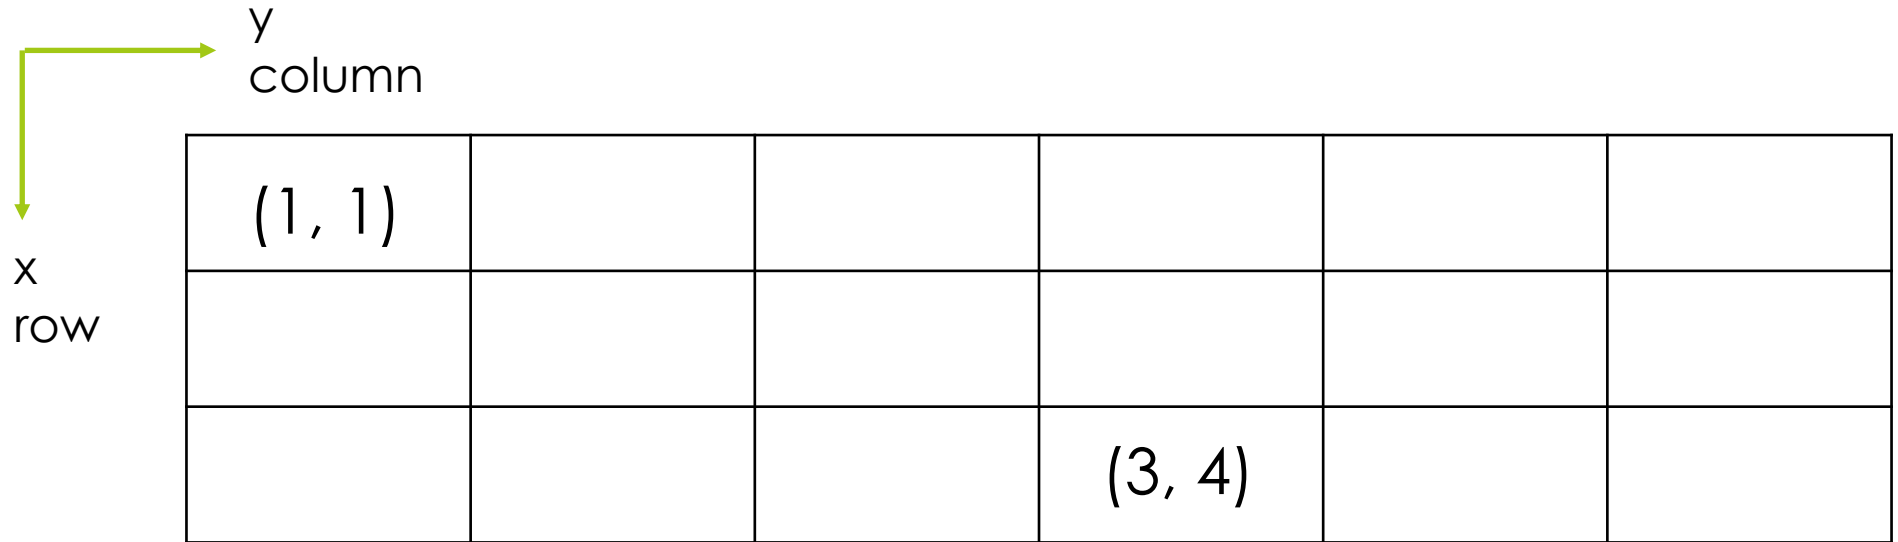

What's special about Arrays?

- Constant-time Access
- Given an index i , reading time and writing time are constant

$$\text{accessing_addr} = \text{array_addr} + \text{element_size} \times (i - \text{first_index})$$

Multi-Dimensional Array

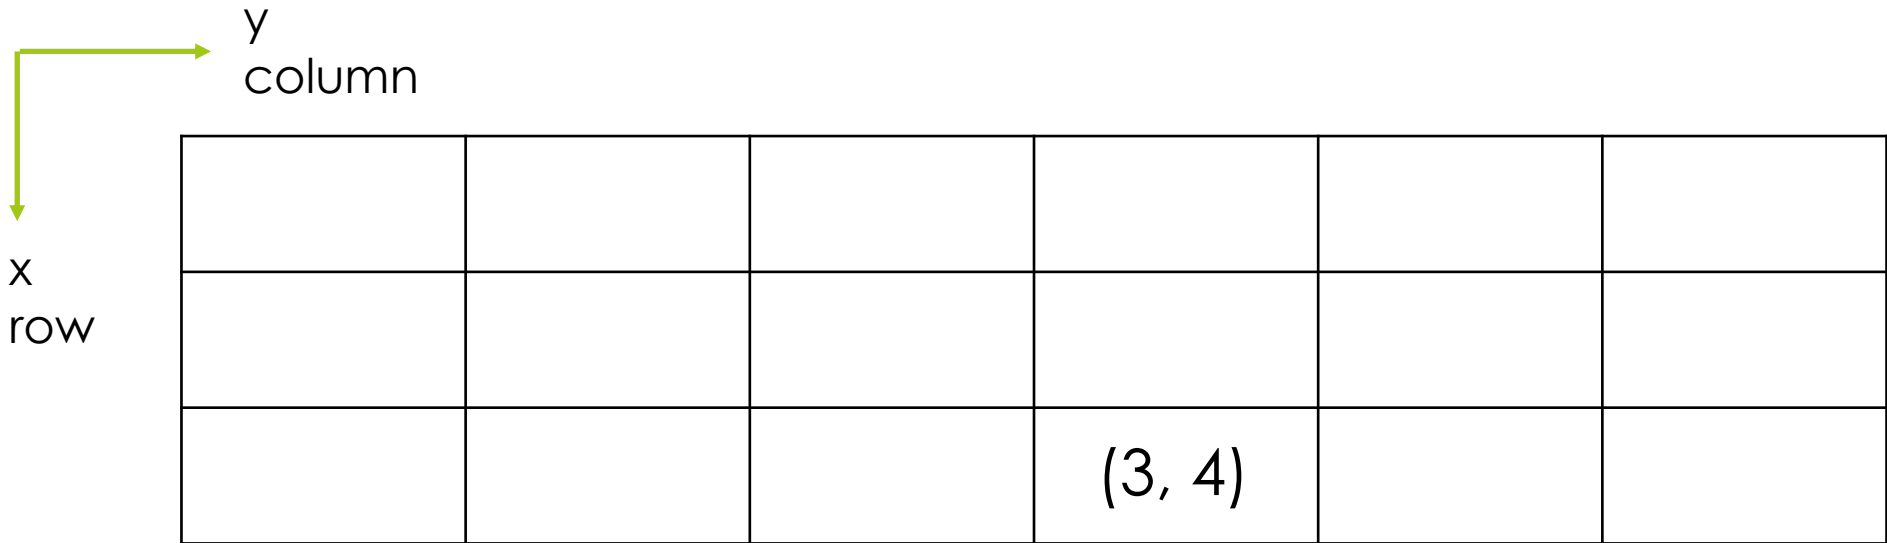

A diagram illustrating a 2D array structure. It consists of a 3x6 grid of cells. The first cell in the top-left corner contains the coordinates (1, 1). The third cell in the bottom row contains the coordinates (3, 4). To the left of the grid, a green arrow points downwards and is labeled 'x row'. Above the grid, a green arrow points to the right and is labeled 'y column'.

(1, 1)					
			(3, 4)		

`my2DArray(row_index, col_index) = my1DArray(index)`

Multi-Dimensional Array using 1D array

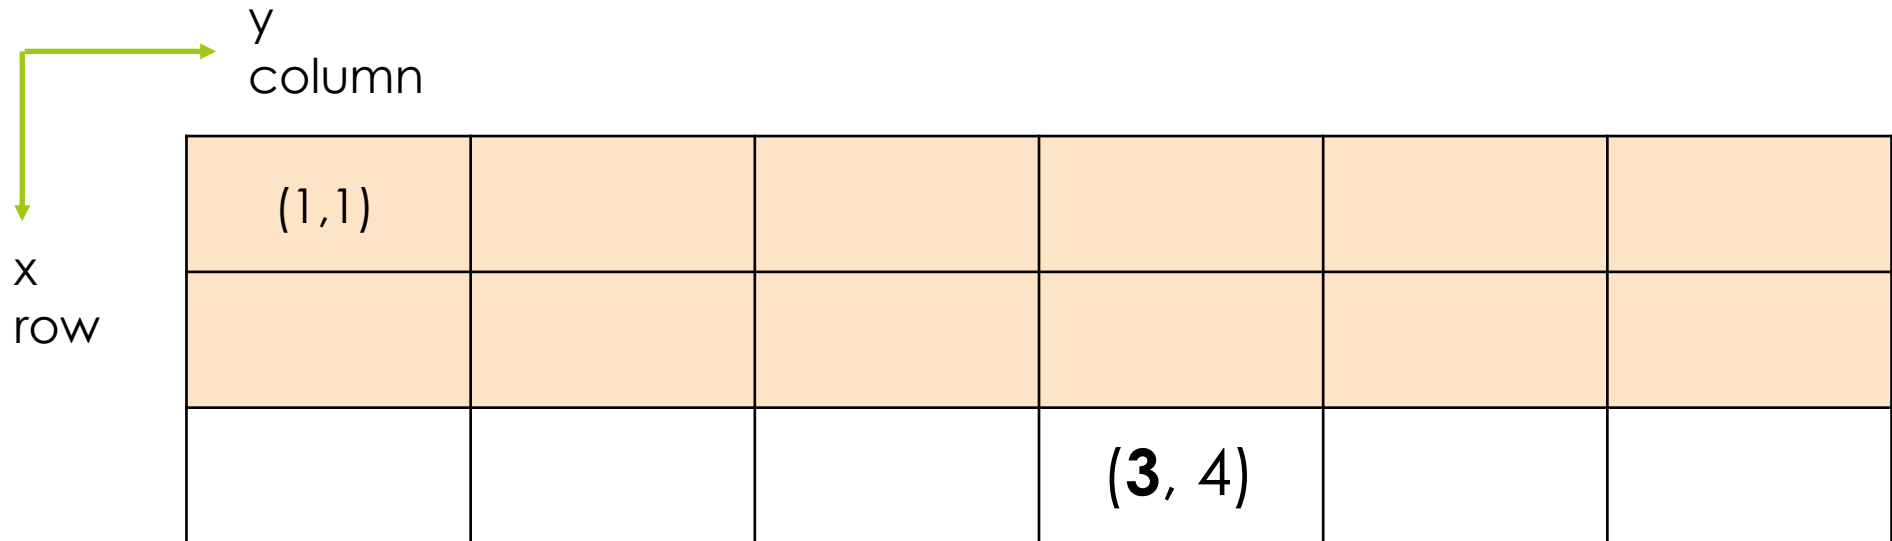

A diagram illustrating a 2D array structure. It consists of a 3x6 grid of cells. To the left of the grid, a green arrow points downwards, labeled 'x row'. Above the grid, a green arrow points to the right, labeled 'y column'. The cell at the third row and fourth column is labeled with the coordinates (3, 4).

			(3, 4)		

How to implement 2-dimensional array using one-dimensional array?

If you have a 2D array indexes at (3, 4), what should be the index in 1D array.

Multi-Dimensional Array using 1D array

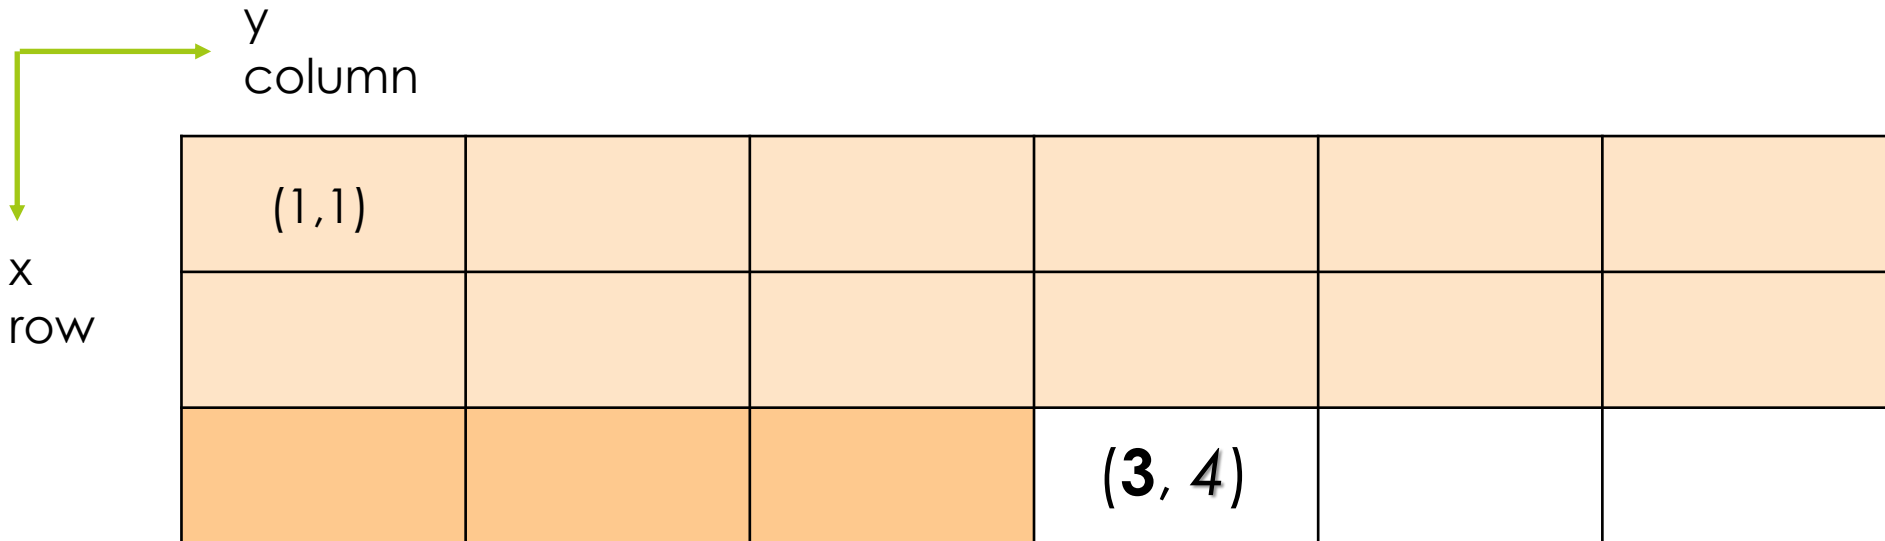

(1,1)					
			(3, 4)		

If you have a *One-indexed* 2D array indexes at (3, 4), what should be the index in **Zero-indexed** 1D array?

$$(3 - 1) \times 6$$

Multi-Dimensional Array using 1D array

A 3x6 grid of cells representing a 2D array. The top-left cell is labeled (1,1). The bottom-right cell is labeled (3, 4). The grid is divided into three horizontal sections: the top two rows are light orange, the third row is a darker orange, and the last two columns are white. A green arrow points from the top-left to the top-right, labeled 'y column'. Another green arrow points from the top-left to the bottom-left, labeled 'x row'.

(1,1)					
			(3, 4)		

If you have a *One-indexed* 2D array indexes at (3, 4), what should be the index in the **Zero-indexed** 1D array?

$$\text{1D Index} = (3 - 1) \times 6 + (4 - 1)$$

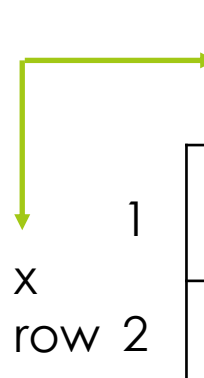

Multi-Dimensional Array using 1D array

If you have a *One-indexed* 2D array indexes at (3, 4), what should be the address in the **Zero-indexed** 1D array?

$$\text{accessing_addr} = \text{array_addr} + \text{element_size} \times ((\mathbf{3} - 1) \times 6 + (\mathbf{4} - 1))$$

Row Major Indexing

	1	2	3	4	5	6
1	0	1	2	3	4	5
2	6	7	8	9	10	11
3	12	13	14	15	16	17

Fill row first, then column

$$(1, 1) \leftrightarrow 0$$

$$(2, 2) \leftrightarrow 7$$

$$(3, 4) \leftrightarrow 15$$

Column Major Indexing

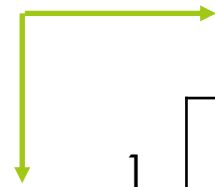

Diagram illustrating Column Major Indexing. The table shows values stored in columns first, then rows. The indices (row, column) are mapped to a linear index.

	1	2	3	4	5	6
1	0	3	6	9	12	15
2	1	4	7	10	13	16
3	2	5	8	11	14	17

$$(1, 1) \leftrightarrow 0$$

Fill column first, then row

$$(2, 2) \leftrightarrow 4$$

$$(3, 4) \leftrightarrow 11$$

Array as a data structure

- Add object (method)
 - After the last object
 - At the beginning
 - At index I
 - Add after a specified object

- Remove object (method)
 - The last object
 - The first object
 - Object at index I
 - Remove a specified object

- Size or Length: number of objects contained (property)
- Capacity or Max: maximum number of objects allowed (property)

Add objects to an array

- After the last object
- At the beginning
- At index i
- Add after a specified object

Add objects to an array

- After the last object
- What is Big O of the AddLast operation?
- Ans: $O(1)$

Add objects to an array

- After the last object
- At the beginning
- At index i
- Add after a specified object

Add an object to the beginning of an array

- At the beginning
- What is the Big O?
- Ans: $O(n)$

Remove an object to the beginning of an array

- At the beginning
- What is the Big O?
- Ans: $O(n)$

Size = 5, Cap = 9

a

Size = 4, Cap = 9

Times for Common Operations

	Add	Remove	Read/Write
Beginning	$O(n)$	$O(n)$	$O(1)$
End	$O(1)$	$O(1)$	$O(1)$
Middle	$O(n)$	$O(n)$	$O(1)$

5	8	3	12	4				
---	---	---	----	---	--	--	--	--

Summary

- Array: Contiguous area of memory consisting of equal-size elements indexed by contiguous integers
- Constant-time access to any element
- Constant time to add/remove at the end
- Linear time to add/remove at an arbitrary location

What is the output?

```
int[] myArray = new int[10];  
  
for (int i = 0; i < 10; i++) {  
    myArray[i] = i;  
}  
  
for (int i = 0; i < 10; i++) {  
    System.out.println(myArray[i]);  
}
```

Your choice?

1. Compilation error
2. Runtime Exception
3. Nothing
4. Print out numbers?

Assume that the following code is in a proper main function

What is the output?

```
int[] myArray = new int[5];  
  
System.out.println(myArray[0]);  
  
myArray[0] = 1;  
  
System.out.println(myArray[0]);  
  
myArray = new int[10];  
  
System.out.println(myArray[0]);
```

Your choice?

1. Compilation error
2. Runtime Exception
3. Nothing
4. Print out numbers?

Assume that the following code is in a proper main function

What is the output?

```
int[] myArray = new int[10];  
  
for (int i = 0; i <= 10; i++) {  
    myArray[i] = i;  
}  
  
for (int i = 0; i <= 10; i++) {  
    System.out.println(myArray[i]);  
}
```

Your choice?

1. Compilation error
2. Runtime Exception
3. Nothing
4. Print out numbers?

Assume that the following code is in a proper main function

Problem with static array???

- Static arrays are static!
- Static array size is fixed; if there is a new coming object (there always is), it will be an error “ArrayIndexOutOfBoundsException”.
- What is the solution?
 - Use other data structures!
 - If you still prefer “constant time to read/write” and “integer indexing”, what should you do?
 - Dynamic arrays can be your solution

Dynamic Array

- Dynamic array is an array
 - Contiguous area of memory consisting of equal-size elements indexed by contiguous integers
 - Constant time to read/write
- What special is: Dynamic array can always accept new data
- The idea is: Dynamic array will extend its capacity when the size is full
- The implementation trick is: (1) If array is full, create a new array with a bigger size, (2) Change *the array reference* to a new bigger reallocated array.

Dynamic Array Resizing

Event 1: Allocate a dynamic array name "arr" type "char" with initial cap of 2

Event 2: Add a new character 'a' → Size < Cap → Just add it

PushBack('a')

Dynamic Array Resizing

Event 3: Add a new character 'b' \rightarrow Size < Cap \rightarrow Just add it

Event 3: Add a new character 'c' \rightarrow Size == Cap \rightarrow Resize the array and Add

Dynamic Array Resizing

Implementation Step 1: allocate a new array with the same type but the capacity is double the old capacity

PushBack('c')

Implementation Step 2: Copy all data from the old array to the new array at the same position

Dynamic Array Resizing

Implementation Step 3: Change the reference to the new array

Implementation Step 4: Delete the old array (Automatically done in Java)

Dynamic Array Resizing

Implementation Step 5: Add the new data as usual

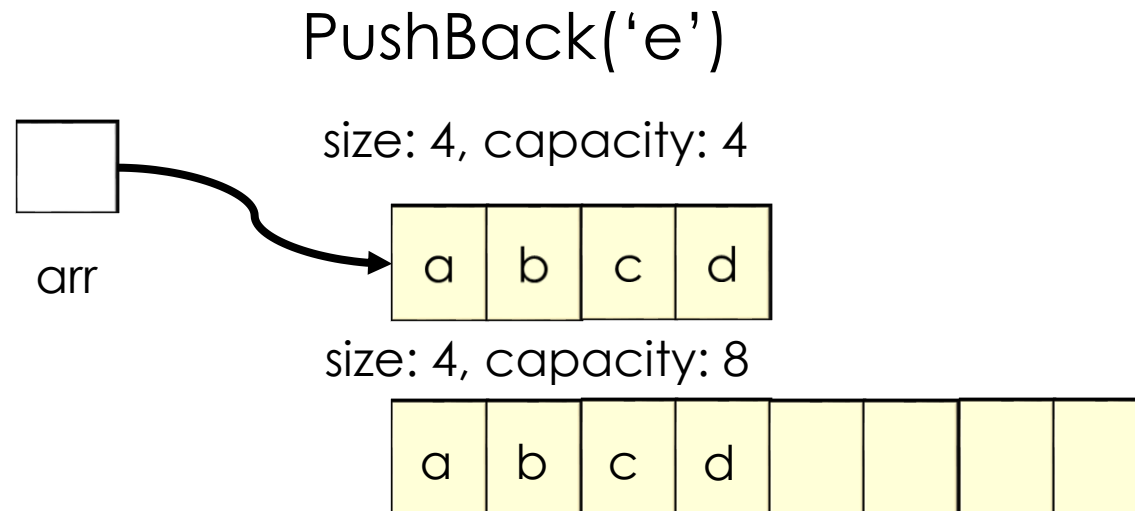

Event 4: Add a new character 'd' → $\text{Size} < \text{Cap}$ → Just add it

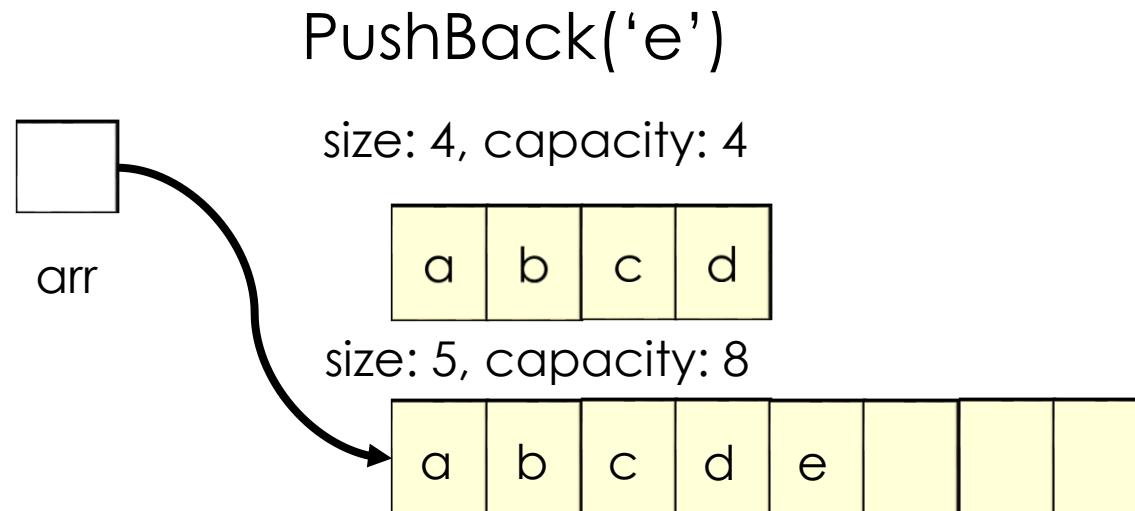

Dynamic Array Resizing

Event 5: Add a new character 'e' → Size == Cap → Resize the array and Add

Dynamic Array Resizing

Event 5: Add a new character 'e' → Size == Cap → Resize the array and Add

Dynamic Array Resizing

Event 5: Add a new character 'e' → Size == Cap → Resize the array and Add

Dynamic Array as a ADT

- Dynamic Array should have the following operations (at minimum):
 - **Get(i)**: Return element at location i^*
 - **Set(i , $value$)**: Sets element i to $value^*$
 - **PushBack($value$)**: Adds $value$ to the end
 - **Remove(i)**: Removes element at location i

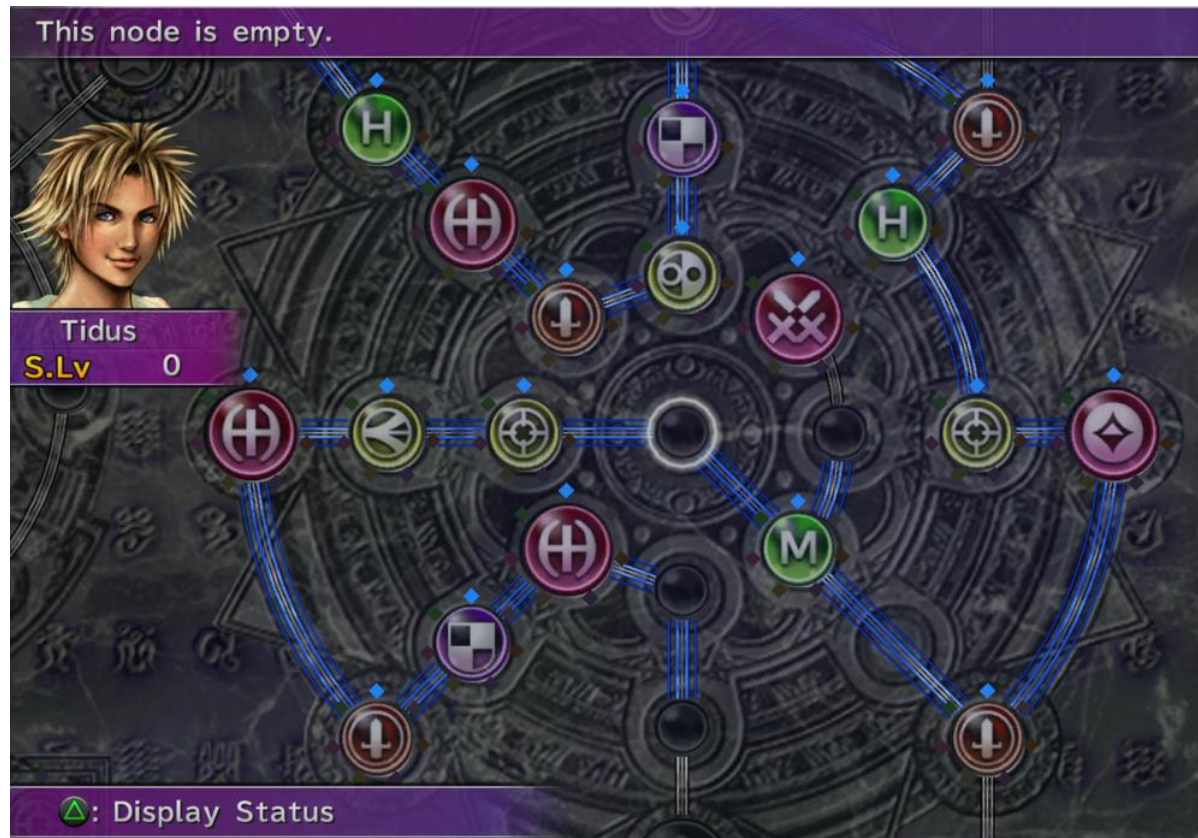

Dynamic Array as a ADT

- Dynamic Array should have the following properties (at minimum):
 - **arr**: dynamically-allocated array reference
 - **capacity**: size of the dynamically-allocated array
 - **size**: number of elements currently in the array
 - In the homework, these variables should be set to private, you should implement additional method to return the values.

Homework: Implement Dynamic Array

- Demo with PushBack, PopBack and PrintAll
- Your job is to do the rest

FFX Sphere Grid
