## Data 27/8/2021

## FindClosest Leaf - Nodeใหม่ จะออกออกลกจากใน

FindClosestleaf (4.2) return Node 60 .

FindClosest (4.2) return Node (4).

Find Closest (Minuzin recoursive) Node current = root while (current != null) current = current. Left

## Insertion Operation

98 Find Closest Leaf (msvinua 3 v www)

r = Final Closest (Inserting key) r. key == inserting key return (สนเหลือนกันโรย ~~) if (insurling key < r. key) who note in the if (inserting Key > r.key) เพิ่ม mode ข้าวบอา

Yallo Find Closest Leaf (O(h)) / Complete Binary Search (O(log n)) (on thouse not bean as nouthailet)

public Class Node { Node left; Node right; น้องไล่กัน ไปดูในหลิปเอานะ T^T

public class Tree Node root; public void insert (mt key) if (root == null) root = new Node (key) else insert (root, key)

> public static void insert (Node current, int insert\_key) if (current. key == insert\_key) print "Duplicate key" else if (Insert\_key < current.key) if (current. left == null) current. left == new Node (insert\_k-uy) Current. left. parent = current else insert (current left , insert\_key) else

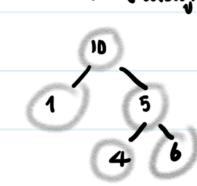

if (current. right == null) current tight == new Node (insert\_key) Current. right. parent = current else insert (current right, insert\_key)

## Deletion Operation

1) Au root Node 250 Non root Node

ขึ้นที่คนนัก ~

Case 1 (ไม่มีถูก)

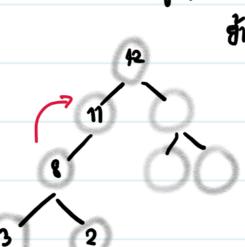

Node P = node 4. pavent f. left = null

node 4. parant = null (optional)

Case 2 (an1)
